- Screenshot with the received email

- A short (4 –6 sentences) explanation of the workflow:

In this scenario I simulate a full payment-failure alert workflow without relying on any external systems. I start by using a **Set Variables** module to define customer, plan, amount, currency, and status data. A **Router** then evaluates the **status** value: if it is not **payment_failed**, the flow ends immediately; if it *is* a failure, the alert path is triggered. In the failure path, a **Compose** module generates a formatted alert message containing all relevant details and a timestamp. The message is then sent to a custom URL using an **HTTP module**, allowing webhook.site to capture and display the notification. Finally, the flow sends an email alert to the email address I specified (this can be changed) using Make.com's built-in Gmail integration.
